~ No. 18/18 DAMAGE BY MOBILE COMMUNICATION ~

INTRO

In the last two decades, new mobile phone technologies have developed rapidly, and mobile communications have turned into a significant economic factor. The next development step will be the introduction of the new 5G mobile communications system throughout Europe by the end of 2020. As the new 5G technology is in the microwave range of electromagnetic radiation, which is impaired by metals, precipitations and vegetation, new mobile communication transmitters are to be developed. Consequence: Radiation exposure will permanently increase even more.

In contrast to the mobile communications lobby, scientists and physicians warn against mobile technology, especially against the development of 5G telecommunications. For more than ten years, studies have already proven serious damage to people's health through mobile radiation. Since then, there have been only a few current studies, as the mobile communications industry is obviously not interested in information about the documented damage and further investigations. Voices even testify that the mobile communications industry impedes or deliberately manipulates further studies in this field in order to conceal incriminating facts.

This issue gives an overview of the shocking results of various studies.

The editors (ch.)

Damages by mobile communication

Health consequences: increased cancer rate

- A study from the town Naila in Upper Franconia, Germany, with measurements taken over a period of ten years (1994-2004) shows that within a radius of 400 m to a mobile communications antenna, 41 people were diagnosed with cancer. Within a radius of 400-800 m, there were only twelve cases. So, the cancer rate inside this 400 m radius was increased by 300%. The results of this study were confirmed by a comparable study in Belo Horizonte, Brazil, with approx. two million people involved.
- In Steinbach-Hallenberg (Germany, 2006), the cancer rate in proximity to an antenna was increased eightfold.
- In Mittelstenahe/Cuxhaven (Germany, 2007) of the 260 inhabitants living within proximity to an antenna, 30 were diagnosed with different types of cancer, which is more than one in eight residents.
- Dr. Oberfeld from Salzburg published a study showing that in the years 1984-1997 the following effects could be observed within a 200 meter radius around a c-net radio mast: 24x increased rate of female breast cancer, over 100x increased rate of brain tumours, overall 8x increased rate of other types of cancer.
- In 2002, 36 mobile communication antennas in close vicinity to a school in the Spanish town of Valladolid were shut down by a court order. The reason for this was 13 pupils developing leukaemia within a short period of time.
- An Italian study from 2001 demonstrates that childhood leukaemia increased by 220% within proximity to a mobile communications antenna.
- In 2009, the Brescia Higher Regional Court (Italy) passed a sentence which was confirmed by the Rome Supreme Court: the brain tumour of an employee was found to be a consequence of him doing business related to hour-long phone calls with a mobile and DECT telephone. The judges excluded industry-financed assessments as not credible and only relied on industry-independent ones.

In 2011, the WHO attributed radio-frequency electromagnetic fields to category 2B on the list of carcinogens. 31 experts from 14 countries revised the current statement that mobile radiation is only capable of warming up the tissue. Cancer is a non-thermal effect.

Health consequences: ADHD and other childhood diseases

Statistical data from Rosstat and UNICEF show that, in the years 2000-2009, the following childhood diseases increased massively among 15 to 19-year-old age group due to mobile phone usage:

- Neurological disorders: +58%
- Blood diseases and disorders of the immune system: +82%
- Epileptic diseases: +36%
- Disorders of the central nervous system: +85%
- A Danish study of 13,000 children from 2008 shows: if a pregnant woman regularly makes calls using a mobile phone, the child's risk of developing ADHD increases by 50%. Children who are using a mobile before the age of seven have an 80% increased risk.

Health consequences: rouleaux formation

• Rouleaux formation: a healthy hemogram features individually distinguishable red blood cells. Being exposed to mobile radiation, this normal hemogram begins to change. After only three minutes, the red blood cells are agglomerated in a way that makes them look like a roll of coins (or "rouleaux"). A permanent state of this kind of hemogram bears the risk of clots, which can cause stroke, heart attack or pulmonary embolism and so on. [1]

Virus alert! Countervoice web sites seem to be at high risk of virus attacks. Hand-to-Hand Express avoids this danger - information concise and to the point, without using the internet - Advice for all who still consult the links: never access the internet from a PC with sensitive data.

You have important news? Write a short Hand-to-Hand Express article. - Clearly state the major point and name the responsible people! - Sources if possible without internet! - Then send your short article to SuG@infopool.info

Misleading mobile radiation threshold

• The currently valid threshold is based on the radiation intensity, which heats a lifeless (!) body by 1 degree Celsius within 30 minutes. Long-term effects remain unconsidered. Athermal effects – meaning effects that are not based on heat, for example the carcinogenic effect by disrupting the cell membrane and the genetic material – remain unconsidered. That would be like measuring the level of radioactive radiation not with a Geiger counter but instead with a thermometer and then classifying it as innocuous. [2]

Consequences for agriculture

• In 1997, a mobile communication antenna was erected next to a farm in Oettingen/Bavaria, Germany. In the thirteen years after, the following losses resulted from it for the farmer with a stock of cows, averaging 10 cows: 25 cows perished of immunodeficiency, 75 premature births or rather stillbirths occurred and catastrophic hemograms of the cows. The total damage amounted to 70,000 Euros. • A Bavarian cattle study from the year 2000 verifies that the number of deformities in farms having been irradiated with mobile phone radiation showed a 16-fold amount of deformities. [3]

Economic consequences

• Depending on the type, a brain tumor is treated with surgery and radiotherapy or with surgery, chemotherapy and radiotherapy. The cost of chemotherapy for a brain tumor alone amounts to around 20,000 Euros. • A calculation in 2009 showed that Germany spent 14 billion Euros on the treatment of cancer. • The costs of all cancer cases in the EU in 2009 amounted to 126 billion Euros. Of this total, 51 billion Euros were spent on the health care system, 43 billion Euros on lost productivity through early deaths, 9.4 billion Euros on work loss and 23.2 billion Euros on nursing care provided by family members. • Economic consequences are clearly evident in the depreciation of real estate. Real estate agents and house owners who want to sell real estate experience mobile communication antennas as a major obstacle in sales conversations. Real estate depreciation of up to 50% is not uncommon if there is a mobile communication antenna in the neighborhood or on the house's own roof. [4]

Victory corner:

Dismantling of mobile communication antennas thanks to civil community

boh. In 1998 and 2007, mobile communication antennas were set up in Villeneuve-de-la-Raho, near Perpignan (France), just a few meters away from houses and a school. In the following years, three children from this school were suffering from cancer, one of which died. Before setting up the antennas, there was not a single case of cancer at this school. The village doctor and the nurse have noted an increase in cancer, strokes, headaches and chronic fatigue. After an insistent nine-year struggle by the civil community, supported by national associations and the local press, a court order was issued to dismantle 19 antennas. This victory encourages the inhabitants of other villages to work together to eliminate mobile communication antennas. [5]

Closing Point •

If the studies mentioned above would be repeated nowadays, one would expect significantly more massive health and economic damage because exposure to radiation has increased massively since the introduction of every new generation of mobile communications.

You as a citizen can do something against this increasing exposure to radiation:

In your personal environment you can reduce exposure to radiation by e.g. switching off the WiFi when it is not used and switching your cell phone over to flight mode during the night. Even better is it of course to do without WiFi and cell phone at all.

In order to prevent the further extension of the mobile communications network with new antennas, the spreading of the previously mentioned facts to responsible persons in politics and healthcare is urgently necessary. Many politicians do not know anything about the severe effects of mobile radiation and can therefore easily be persuaded by the mobile communication's lobby for network extensions. However, those who know of these studies and are elected representatives will stand against the further increase of radiation.
